

Weekly Progress Report
Amity School of Engineering & Technology
B. Tech: Program

WPR No: 9	Duration: 14 September 2026 – 20 September 2026
------------------	--

Weekly Progress Report (WPR) for Minor Project

To be filled by Students	
Students Name	Rohit Yadav, Vishal, Hardik Mehlawat (Group 148)
Roll no.	472 (Rohit), 568 (Vishal), 449 (Hardik)
Enrollment no.	A2305223472 (Rohit), A2305223568 (Vishal), A2305223449 (Hardik)
Project Title finalized, if Yes, give name, if NO, give reason	Yes — Deep Learning for AI-Generated Image Detection: A Review of CNN, Vision Transformer, and Explainable Approaches
Synopsis submitted	Submitted (on Amizone, with offer letter)
Literature review	Complete — master comparison table now covers all 48 primary studies in one row each across the eight fixed columns, machine-checked against the extraction table (48/48 rows matched)
Technical & Economical Feasibility	Not started
Bill of Material	N/A (literature review project this semester)
Project Progress Schedule (PERT Chart)	Week-wise schedule prepared; PERT chart pending
Design of critical components	Paper structure fixed (8 sections); Section 3 taxonomy finalised across subsections 3.1–3.5; dataset comparison table, master literature comparison table and the metrics/search-flow figures fixed
Fabrication work (give %)	N/A
Experimental work (give %)	Not started (planned for Semester 8)
Result and Analysis	Not started
Report writing	In progress — Sections 1–6 drafted (about 8,500 words); master comparison table done; challenges/gap analysis and conclusion next
Signature of students	

Work done in this week

The master literature comparison table was built this week, and Section 6 (comparative analysis) was drafted from it. The table gives all 48 primary studies one row each, ordered by year, across the eight columns fixed in the project brief: study, detection approach, model or architecture, dataset used, generators covered, reported accuracy or AUC, whether a cross-generator test is reported, and the limitation the authors themselves state. Every cell was compressed from the extraction table rather than re-read from the papers, and the finished table was then checked against that extraction table by script — all 48 rows matched, with no mismatch in author strings, accuracy figures or cross-generator flags. Section 6 runs to 1,532 words and cites 44 references, and is organised around counts tallied directly from the table so that each claim stays re-checkable: 36 of the 48 studies report a cross-generator evaluation; 20 cover GAN-era generators only, 8 diffusion only and 19 both; 15 train on the same ProGAN distribution; and roughly 38 report accuracy, 14 average precision and 9 AUC. The synthesis traces the chronological arc of the field — near-perfect results on a single artefact, transfer-learning CNNs, the accuracy collapse that followed the arrival of diffusion images, methods that classify a derived input, and detectors built on frozen foundation-model features — and then asks what the rows with strong cross-generator numbers have in common. It also examines what the headline figures hide, and locates explainability in only four of the 48 rows. The section closes by identifying the one combination that no surveyed study reports: several ImageNet-pretrained CNN backbones compared against a ViT benchmark under a single protocol, with explanation analysis and a cross-generator test — the gap Section 7 will formalise. Sections 1 to 6 are now drafted at roughly 8,500 words, supported by the master comparison table, the dataset comparison table and two figures. Section 7 (challenges and gap analysis), Section 8 (conclusion) and the abstract are scheduled next.

To be filled by Guide (strike off whichever is not applicable)
